

VersaTest OEM is designed for companies that deal with a wide range of networks and external partner organizations. VersaTest OEM solutions are customized to target specific testing needs, so helping to fast track the certification, uptake and deployment of new partners and technology.

The Power of a Common Testing Tool

Monitoring, testing and modifying systems for optimal performance is a critical step prior to “live” use. The VersaTest platform allows this to occur with ease of use in an organization. But, if the organization has a group of partners exchanging information in a network, all the internal testing will be discounted, if everyone isn’t speaking the same language.

The VersaTest OEM solution allows for all of an organization’s trading partners to have access to a common set of testing and verification tools. This is especially important in communication configurations such as financial institutions where central payment gateways or payment card authorization systems are used.

Using a turnkey approach to promote common testing methods, the VersaTest OEM solution is easily configured to fit the specific environment of an individual company. Plus it’s flexible enough to work in any industry.

Common Tools Produce Great Results

Use of VersaTest OEM provides phenomenal results! Users find that they are able to test more frequently with greater reliability, freeing up resources to focus on other needed activities. Partner certification testing that previously took weeks to execute can be completed in a matter of hours, providing significant ROI through time savings alone. Reports generated by VersaTest OEM can be used for auditing of the certification process.

Ascert’s VersaTest software allows for rapid, flexible and accurate testing of system efficacy.

- Streamlines vendor / partner certification processes
- Enables a full audit trail of tests to ensure partner compliance
- Partners get tools needed to carry out targeted regression and performance testing
- Supports in-house use for testing of central switches and infrastructure components
- Supported platforms include HP NonStop Server, Windows, Linux, AIX, Solaris

VersaTest OEM Product Overview

VersaTest OEM is a turnkey solution that allows companies to package and extend their testing environment to their trading partners. A common toolset and method of testing creates tremendous power and synergies and ensures accuracy of communication protocols and messaging.

The VersaTest OEM product is easily configured to fit into an organization's environment and uses a "private label" approach to deployment. The VersaTest OEM functionality and user experience for your trading partners is tuned to meet your requirements. Your testing and certification processes are seamlessly and inexpensively transferred to your trading partners and certification testing becomes more streamlined.

Scripts for custom interfaces can also be developed and VersaTest OEM is flexible enough to incorporate other third party tools, or even be embedded into third party devices to allow embedded host-simulation.

VersaTest OEM Services

- Private label branding with a "powered by VersaTest" logo
- Creation of common and shareable certification packs
- Provision of central systems that members connect into for functional and/or performance testing
- Ascert managed hosting of central test systems
- Independent auditing of certification results
- Central visibility of results, either using the VersaTest toolset or 3rd party tools, such as HP Quality Center

Platform Support

VersaTest OEM will run on any platform which supports the Java Runtime Environment. This includes, Windows platforms, Linux, AIX, Sun Solaris and HP NonStop Servers.
